HW1.5: Tumblr Redux (Extra Credit)

Due March 28th at 11:59 PM. Recommended to take around 3 hours.

Description

The blog we built in HW1 was a very primitive application that did not take into the implications of security or scalability. In this assignment, we will account for this by utilizing the Django models. Your task is to reimplement HW1 using the Django framework. Your implementation should make use of Django models (foreign keys, dates, text fields, etc.) as well as the markdown2 package. The only security needed is that of the Django Admin portal.

Grading

Your assignment will be worth anywhere from 5% to 10% (assuming your implementation is correct), depending on the depth of your implementation. These will be added to your score of HW2.
